## NATIONAL SENIOR CERTIFICATE

## GRADE 12

MARKS: 150

These marking guidelines consist of 9 pages.

## SECTION A

## QUESTION 1

1.1 | 1.1 .1 | $C \checkmark \checkmark$ |  |
| :--- | :--- | :--- |
|  | 1.1.2 | $\mathrm{B} \checkmark \checkmark$ |
|  | 1.1.3 | $\mathrm{C} \checkmark \checkmark$ |
|  | 1.1.4 | $\mathrm{B} \checkmark \checkmark$ |
|  | 1.1.5 | $\mathrm{A} \checkmark \checkmark$ |
|  | 1.1.6 | $\mathrm{C} \checkmark \checkmark$ |
|  | 1.1 .7 | $\mathrm{C} \checkmark \checkmark$ |
|  | 1.1.8 | $\mathrm{D} \checkmark \checkmark$ |
|  | 1.1.9 | $\mathrm{B} \checkmark \checkmark$ |

$(9 \times 2)$
1.2 1.2.1 Hydrogen $\checkmark$ bonds
1.2.2 Genome $\checkmark$
1.2.3 Cultural $\checkmark$ evidence
1.2.4 Speciation $\checkmark$
1.2.5 Haemophilia $\checkmark$
1.2.6 Foramen magnum $\checkmark$
1.2.7 Alleles $\checkmark$
1.2.8 Discontinuous $\checkmark$ variation
1.2.9 Gonosomes (9 $\times 1$ )
1.3 1.3.1 A only $\checkmark \checkmark$
1.3.2 Both A and B $\checkmark \checkmark$
1.3.3 A only $\checkmark \checkmark$
$(3 \times 2)$
1.4 1.4.1 D-Chromatid $\checkmark$

E-Centromere $\checkmark$
1.4.2 $23 \checkmark$ pairs
1.4.3 (a) E $\checkmark$
(b) $C \vee / B$
1.4.4 (a) Nucleus $\checkmark$

Mitochondrion $\checkmark$
(Mark first TWO only)
(b) Double helix $\checkmark$
(c) (DNA) Replication $\checkmark$

### 1.5 1.5.1 Phylogenetic tree $\checkmark /$ cladogram

1.5.2 An exoskeleton $\checkmark$
1.5.3 (a) $S \checkmark$
(b) $T \checkmark$
1.5.4 (a)Trilobites $\checkmark$
(b) Helmetids $\checkmark$
(c) Tegopeltids $\checkmark$
OR
(b)Tegopeltids $\checkmark$
(c) Helmetids $\checkmark$
(d) Naraoids $\checkmark$

## QUESTION 2

2.1 2.1.1 - Due to non-disjunction $\checkmark /$ Non-separation of a chromosome pair

- during Anaphase IV
- Two chromosomes moved to the one pole $\checkmark$ and
- none moved to the other pole $\checkmark$

Any
2.1.2 - Gamete A will have 24 chromosomes $\checkmark$ /an extra chromosome

- and when it fertilises a normal ovum $\checkmark /$ gamete with 23 chromosomes
- the zygote will have 3 chromosomes at position $21 \checkmark / 47$ chromosomes
2.1.3 (a) Prophase IV
(b) - Adjacent chromatids of homologous chromosomes cross $\checkmark$
- at a point called the chiasma $\checkmark$
- There is an exchange of DNA segments $\checkmark$ /genetic material
(c) - Crossing over introduces genetic variation $\checkmark$ in gametes
- Genetic variation may result in favourable characteristics $\checkmark$
- that ensure a better chance of survival $\checkmark$
- when environmental conditions change $\checkmark$

## OR

- Crossing over introduces genetic variation $\checkmark$ in gametes
- Genetic variation may result in unfavourable
- characteristics $\checkmark$
- that reduce the chance of survival $\checkmark$
- when environmental conditions change $\checkmark$ Any
$2.2 \quad$ 2.2.1 $\quad$ (a) Female without SCID $\checkmark$
(b) Male with SCID $\checkmark$
(c) $X^{D} X^{d} \checkmark \checkmark$
2.2.2 - He inherited the recessive allele $\checkmark / X^{d}$
- from the mother $\checkmark$ /individual 4
2.3 2.3.1 (a) It allows for the production of organisms with desired characteristics $\checkmark /$ high average milk yield
(Mark first ONE only)
(b) - It reduces genetic variation $\checkmark$ in offspring
- It results in no further genetic improvement $\checkmark$
- It is expensive $\checkmark$
- It may not be economical for commercial agriculture $\checkmark$
(Mark first ONE only)
Any
2.3.2 LMJC 865 had a high average milk-production yield $\checkmark /$ produced 78 litres per day/ had the desired characteristic
2.3.3 - A diploid cell $\checkmark /$ a cell with all the genetic information is needed
- An ovum is a haploid cell $\checkmark /$ only contains half of the genetic information
2.3.4 - The nucleus of an ovum is removed $\checkmark$ and replaced with
- the nucleus of a somatic donor cell $\checkmark /$ diploid donor cell
- The zygote is stimulated $\checkmark$
- for mitosis $\checkmark$ to occur
- The embryo is then placed into the uterus of an adult female $\checkmark$

## OR

- Plants may be cloned by vegetative reproduction $\checkmark /$ asexual reproduction /tissue culture/grafting
- A plant with the desired characteristics is selected $\checkmark$
- A vegetative part of the "parent" plant structure is removed $\checkmark /($ examples) and
- placed inside a growth medium $\checkmark /$ (examples)
- and allowed to grow $\checkmark$

Any 4

### 2.4 2.4.1 Purple $\checkmark$

2.4.2 - When purple-flowering plants and white-flowering plants are crossed

- all the offspring have purple flowers $\checkmark /$ have no white flowers
2.4.3 - The two alleles for a characteristic $\checkmark$
- separate during meiosis $\checkmark$ so that
- each gamete contains only one allele $\checkmark$ for that characteristic
2.4.4

| $\mathrm{P}_{1}$ | Phenotype Genotype | Purple Dd | x | Purple $\checkmark$ Dd $\checkmark$ |
| :---: | :---: | :---: | :---: | :---: |
| Meiosis |  |  |  |  |
|  | G/gametes | D, d $\underbrace{\text { d }}$ D, $d r$ |  |  |
| Fertilisation |  |  |  |  |
| $\mathrm{F}_{1}$ | Genotype | DD; |  | $\checkmark$ |
|  | Phenotype | Pur |  | ite $\checkmark^{*}$ |

$P_{1}$ and
$F_{1} \checkmark$
Meiosis and fertilisation $\checkmark$
*Compulsory $1+$ Any 5

## OR

| $\mathbf{P}_{1}$ | Phenotype | Purple | x |
| :--- | :--- | ---: | :--- |
|  | Genotype | Dd | Purple $\checkmark$ |
|  | Dd $\checkmark$ |  |  |

Meiosis
Fertilisation

1 mark for correct gametes
1 mark for correct genotypes
$F_{1}$
Phenotype
$P_{1}$ and
$F_{1} \checkmark$
Purple: White ${ }^{\text {* }}$
Meiosis and fertilisation $\checkmark$
*Compulsory 1 + Any 5

## QUESTION 3

3.1 3.1.1 - The jaw is large in the chimpanzee $\checkmark$ and small in Homo sapiens $\checkmark$

- The jaw/ palate is rectangular in the chimpanzee $\checkmark$ and rounded in Homo sapiens $\checkmark$
- Large spaces between the teeth in the chimpanzee $\checkmark$ and small/no spaces in Homo sapiens $\checkmark$
- Large canines/teeth in the chimpanzee $\checkmark$ and small canines/teeth in Homo sapiens $\checkmark$

Any $1 \times 2$
(Mark first ONE only)
3.1.2 - The diet changed from eating raw food $\checkmark$ in Australopithecus

- to a diet of cooked food $\checkmark$ in Homo sapiens
3.1.3 (a) A transitional species shows intermediate characteristics between two genera/species $\checkmark$

## OR

It has characteristics common to both the ancestor species and the species that follows $\checkmark$
(b) The jaw is smaller than that of the chimpanzee but larger than that of Homo sapiens $\checkmark \checkmark$

## OR

The canines/ teeth are smaller than those of the chimpanzee but larger than those of Homo sapiens $\checkmark \checkmark$

## OR

The jaw/ palate shape is more rounded than that of the chimpanzee but less rounded than that of Homo sapiens $\checkmark \checkmark$

Any $1 \times 2$
(Mark first ONE only)
3.2 3.2.1 - The bright colour pattern is associated with being poisonous $\checkmark$

- thus reducing predation $\checkmark$ and
- improving the chances of survival $\checkmark$
3.2.2 - There is variation in the colour of kingsnakes $\checkmark$
- Some are bright in colour $\checkmark /$ resemble the coral snakes and
- the others are dull in colour $\checkmark$
- Those with dull colours are killed $\checkmark$ by predators
- Those with bright colours are not eaten $\checkmark$
- so they survive $\checkmark$ and reproduce,
- passing on the allele for bright colour to the next generation $\checkmark$

Any 6
3.3 3.3.1 1900
3.3.2 $\left\{\frac{80}{20}\right\} \checkmark \times 100 \checkmark=400 \checkmark \%$

> OR
$\left\{\frac{(100-20)}{20}\right\} \checkmark \times 100 \checkmark=400 \checkmark \%$
3.3.3

| T $\checkmark$ |  |
| :--- | :--- |
| Natural selection | Artificial selection |
| The environment or nature is <br> the selective force $\checkmark$ | Humans represent the selective <br> force $\checkmark$ |
| Selection is in response to <br> suitability to the environment $\checkmark$ | Selection is in response to <br> satisfying human needs $\checkmark$ |
| Occurs within a species $\checkmark$ | May involve one or more <br> species $\checkmark$ (as in cross breeding) |

(Mark first TWO only)
3.4 3.4.1 - They invade farm fields $\checkmark$

- They outcompete the crop plants for space $\checkmark$ Any
3.4.2 (a) Type of herbicide $\checkmark$
(b) Time taken for development of resistance $\checkmark$
3.4.3 (a) Dicloflop $\checkmark$
(b) Trifluralin $\checkmark$
3.4.4 (a) - They would apply the herbicide to the weed $\checkmark$ and
- observe if the weed survives $\checkmark$ over many generations
(b) - They used the same weed species as other weed species may have developed resistance to that herbicide $\checkmark$
- Each weed species may respond differently $\checkmark$ to a herbicide

## OR

- It allows for a single variable $\checkmark$
- to which all results can be attributed $\checkmark$
3.4 .5

Guideline for assessing the graph

| Type: Bar graph drawn (T) | 1 |
| :---: | :---: |
| Title of graph | 1 |
| Correct: <br> - Scale for Y -axis and <br> - Width and interval of bars on Xaxis | 1 |
| Correct: <br> - Label for X-axis and <br> - Label and unit for Y -axis | 1 |
| Plotting of bars | 1-1 to 4 bars plotted correctly <br> 2- All 5 bars plotted correctly |

## SECTION C

## QUESTION 4

## Structure (S)

- RNA is single stranded $\checkmark$
- and is made up of nucleotides $\checkmark$ which comprise:
- ribose $\checkmark$ sugar
- phosphate $\checkmark$ group
- nitrogenous bases $\checkmark$ which are
- adenine, uracil, guanine and cytosine $\checkmark$ / (A, U, G and C)
- The phosphate group is attached to the ribose sugar $\checkmark$
- and the nitrogenous base is attached to the ribose sugar $\checkmark$
- Bases on RNA are arranged in triplets $\checkmark$
- as codons on mRNA $\checkmark$
- and anticodons on tRNA $\checkmark$
- tRNA has a clover-leaf $\checkmark$ /hairpin structure
- tRNA has a place of attachment for an amino acid $\checkmark$

## Involvement in protein synthesis (P)

- mRNA $\checkmark$ forms
- during transcription $\checkmark /$ by copying the coded message from DNA
- and moves out of the nucleus $\checkmark$
- and attaches to the ribosome $\checkmark$
- During translation $\checkmark$
- the anticodon matches the codon $\checkmark$
- tRNA
- brings the required amino acid $\checkmark$ to the ribosome
- Amino acids become attached by peptide bonds $\checkmark$
- to form the required protein $\checkmark$

Any

## ASSESSING THE PRESENTATION OF THE ESSAY

| Criterion | Relevance (R) | Logical sequence (L) | Comprehensive (C) |
| :--- | :--- | :--- | :--- |
| Generally | All information provided is <br> relevant to the question | Ideas are arranged in a <br> logical/cause-effect sequence | All aspects required by the <br> essay have been sufficiently <br> addressed |
| In this <br> essay in <br> Q4 | Only information relevant <br> to the: <br> $-\quad$ structure of RNA and <br> involvement of the <br> different types of RNA <br> in protein synthesis <br> is given <br> There is no irrelevant <br> information | All the information regarding <br> the <br> $-\quad$ structure of RNA and <br> the involvement of the <br> different types of RNA in <br> protein synthesis <br> is given in a logical manner | At least: <br> $-\mathbf{6 / 9}$ correct points for the <br> structure of RNA (S) <br> $-5 / 8$ for the involvement in <br> protein synthesis (P) |
| Mark | 1 | 1 | 1 |
