PLEASE READ THE FOLLOWING INSTRUCTIONS CAREFULLY

1. This question paper consists of 19 pages. Please check that your question paper is complete.

2. All the questions must be answered on the question paper.

3. Read the questions carefully.

4. Use the total marks awarded for each question as an indication of the detail required.

5. It is in your own interest to write legibly and to present your work neatly.

QUESTION 1

(a) The THREE graphs below indicate how different types of food affect an athlete's blood glucose levels.

Graph A

**Blood glucose response to High GI food**
(e.g. baked potato)

Graph B

**Blood glucose response to Mid GI food**
(e.g. banana)

Graph C

**Blood glucose response to Low GI food**
(e.g. apple)
(i) Interpret Graphs A, B and C in terms of the blood glucose response to high, medium and low Glycemic Index (GI) foods.

________________________________________________________________________
________________________________________________________________________
________________________________________________________________________
________________________________________________________________________ (5)
(b) Some sport scientists recommend that replacing carbohydrates, immediately following sustained, vigorous exercise, can increase the rate at which glycogen stores in muscles are replenished. The current guideline recommended is that an athlete should consume 1 gram of carbohydrate per kg of body weight following exercise, within 15 – 30 minutes. Further intake of 50 – 100 g of carbohydrate should be repeated every 2 hours following exercise until the athlete is back to his/her usual eating pattern.

What is the application of this recommendation in events such as a hockey or rugby tournament/festival where it is common for an athlete to participate in three matches a day over three consecutive days?

(d) A balanced diet and regular physical activity are the building blocks of good health.

Critically analyse this statement from the following standpoints:

(i) **Beliefs:** Give your personal opinion.

____________________________________________________________________________________________
______________________________________________________________________________________________

(1)

(ii) **Evidence:** Substantiate with a scientific fact why this statement is correct or incorrect.

____________________________________________________________________________________________
______________________________________________________________________________________________

(1)

(iii) **Positives:** Motivate why this statement should be advocated and endorsed.

____________________________________________________________________________________________
______________________________________________________________________________________________
______________________________________________________________________________________________
______________________________________________________________________________________________

(2)

(iv) **Negatives:** Motivate the limitations of this statement.

(2)
QUESTION 2

To Creatine or Not to Creatine? That is the question.

Since the 1992 Barcelona Olympic Games, studies have shown the benefits of creatine 'doping' for high intensity, short duration physical activities.

Creatine is a compound found naturally in the body. About half of the daily needs of creatine are obtained from the diet, mainly from meat, fish and animal products. It can also be obtained by supplementing the diet with artificial/synthetic creatine.

Higher creatine phosphate concentrations in muscles increases anaerobic ATP production during maximal exercise via the ATP-CP energy system and improves resynthesis of creatine phosphate in the recovery periods following short bursts of maximal exercise.

The benefits of creatine supplementation are mixed. The moral-value issue of creatine 'doping' comes into question: is it fair?

(a) An athlete who is supplementing with synthetic creatine may experience enhanced performance. Explain the potential psychological advantages that this athlete may experience.

___________________________________________________________________
___________________________________________________________________
___________________________________________________________________
___________________________________________________________________
___________________________________________________________________
___________________________________________________________________
___________________________________________________________________
___________________________________________________________________

(8)
(b) Creatine supplementation is used freely by some athletes to improve performance because it is considered a 'legal' form of 'doping'. Debate whether the supplementation of creatine for the purpose of performance enhancement should or should not be banned by the World Anti-Doping Agency.
QUESTION 3

The graph below forecasts the development of exceptional endurance fitness for elite swimmers on structured training programmes over 4 years.

(a) What is the relationship between VO$_2$ max and Lactate Threshold (LT)?

___________________________________________________________________
___________________________________________________________________
___________________________________________________________________
___________________________________________________________________
___________________________________________________________________

(b) Account for the slow increment in the efficiency of elite swimmers (depicted in the forecast above) notwithstanding the VO$_2$ max and LT plateaus reached.

___________________________________________________________________
___________________________________________________________________
___________________________________________________________________
___________________________________________________________________

(3) (2)
(c) List **FOUR** reasons why elite swimmers should follow an appropriate (sport-specific) post-exercise 'cool-down' session.

QUESTION 4

Serena Williams' scale of influence is significant.

(a) Comment on the extent of her influence on:

Tournament Revenue:

___________________________________________________________________
___________________________________________________________________

Media Interest:

___________________________________________________________________
___________________________________________________________________

Fan Appeal:

___________________________________________________________________
___________________________________________________________________

Being a role model for girls and women:

___________________________________________________________________
___________________________________________________________________

(4)
(b) Venus and Serena Williams' success in tennis can, to a large extent, be attributed to their father's enabling support. Sport Psychologists agree that performance outcomes are influenced by positive enablers and/or negative barriers. This applies to both individual and team players.

Consider the SITUATIONS in the table below then briefly motivate your answer.

<table>
<thead>
<tr>
<th>SITUATIONS</th>
<th>Positive enablers (tick if this applies)</th>
<th>Negative barriers (tick if this applies)</th>
<th>Motivate why this 'situation' is an enabler or barrier</th>
</tr>
</thead>
<tbody>
<tr>
<td>Coach with a 'win at all costs' attitude</td>
<td></td>

QUESTION 5

(a) Sue Bird is a leading American basketball player and was named 'Most Valuable Player' of the Year 2012.

(i) When performing a jump shot, what is the most important fitness component which Sue would depend on to augment her performance?

________________________________________________________________________ (1)

(ii) Name **ONE** appropriate standard fitness test for assessing this fitness component.

________________________________________________________________________ (1)

(iii) What is the most effective training method that can be used to improve this fitness component?

________________________________________________________________________ (1)

(iv) Which muscle fibre type is predominantly recruited when performing a jump shot?

________________________________________________________________________ (1)

(v) What criteria could be associated with the 'Most Valuable Player' award?

________________________________________________________________________ (2)
(b) As part of her fitness training for basketball, Sue participates regularly in the **THREE** different exercise modalities.

0 = non existent  
1 = at a very low level  
2 = at a low level  
3 = at a medium level  
4 = at a high level  
5 = at a very high level

<table>

___________________________________________________________________ (3)
QUESTION 7

Plot the following athletes onto the graph below by using the symbols provided.

A = high jumper
C = rugby prop
E = basketball guard

B = body builder
D = triathlete
F = sumo wrestler

[3]
QUESTION 8

Design a sport-specific fitness circuit for basketball OR rugby.

The fitness circuit training session is 60 minutes in duration. The players will spend 7 minutes at each station, with 4 minute rest periods between each station. Demonstrate the application of the Principle of Specificity in the selection of fitness activities for either basketball or rugby.

Fitness circuit for __________________________
QUESTION 9

(a) Many sports have developed modified versions of the sport to encourage participation across age, gender and ability.

(i) Select ONE sport and identify TWO modifications that favour accessibility for children.

Sport:  _______________________________________________
Modification 1:  _______________________________________________
Modification 2:  _______________________________________________ (2)

(ii) Explain how ONE of these modifications (mentioned in (i) above) would increase a younger child's ability to perform the skills needed in this sport.

_____________________________________________________________
_____________________________________________________________
_____________________________________________________________ (2)

(iii) Select ONE sport and identify TWO modifications that make the sport more accessible to elderly (60+) participants.

Sport:  _______________________________________________
Modification 1:  _______________________________________________
Modification 2:  _______________________________________________ (2)

(b) Osteoporosis is a health compromising condition which is a cause for concern.

(i) What is osteoporosis?

_____________________________________________________________
_____________________________________________________________ (2)

(ii) How is this condition developed?

_____________________________________________________________
_____________________________________________________________ (2)

(iii) Suggest a preventative strategy which could delay the onset of this progressive condition.

_____________________________________________________________
_____________________________________________________________ (2)
